bash

```
sudo code --user-data-dir=~/.vscode-root --no-sandbox
```

Use code with caution.

The Recommended Fix (Fix Permissions)

Running GUI apps as root is generally unsafe. Fixing the directory ownership is the best long-term solution.

1. **Find VS Code installation path:** Arch usually installs it to `/usr/lib/code/` or `/opt/visual-studio-code/`.
2. **Change ownership:** Run this command to give your user account permission to modify the files (replace `yourusername` with your actual Arch username):

bash

```
sudo chown -R yourusername:yourusername /usr/lib/code/
```

Use code with caution.

(If you use the proprietary version from the AUR, use `/opt/visual-studio-code/` instead). [🔗](#)

Next Steps

1. Open VS Code **normally** (without `sudo`).
2. Toggle the **Neon Dreams** extension on. [🔗](#)
